

# ASTECC Technology Co., Ltd.

## A Powerful Remote Management Tool at no charge

Taipei, Taiwan, September 26, 2008—Astec Technology Co., Ltd, a leading embedded system manufacturer, today officially launched its new Remote Management Software (AMS), a feature-rich tool to manage Astec thin clients on your network or from anywhere. It delivers centrally control in software distribution, asset management and remote assistance to your network while providing superior security, performance, mobilization and TCO.

AMS offers a broad range of settings that allow you to restrict user actions, configure applications, define the user's desktop, configure the Start menu and taskbar, and apply other change control options. Controlling settings through AMS allows you to restrict the changes a user can make to his or her system. By applying these restrictions, you not only enhance security but also reduce administrative overhead associated with repairing unwanted or inadvertent changes that users might make that damage their systems.

AMS is simple to install and offers intuitive configuration and management through a friendly user interface. There's no require consultants or long training cycles to start using it. It can be accessed from anywhere and does not require special servers or reconfiguration of your existing computing infrastructure. Gain remote access to your entire computing infrastructure, increase your productivity and eliminating the need to trust security or risk exposure to outside entities.

AMS is ideal for small, mid-size businesses and large enterprises looking to reduce the cost and complexity associated with individual desktop installations. With this software, SMBs and enterprises can provide fast, secure and centrally managed access to any application for authorized users, anytime, anywhere. AMS comes bundled with all Astec thin clients. It provides comprehensive management control for smaller installations as well as scales up to hundreds of thousands of clients. It is incredibly affordable. With the Unlimited Managed Systems edition, you can manage any number of client computers — **there is no per-client charge.**
